                                              w85284-451 represent helper T-cell class II peptides, which can bind to the human leucocyte antigens (HLA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response for the treatment or prevention of viral, fungal, bacterial or parasitic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostat cancer or condyloma acuminatum). Helper T-cell peptides may be used alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Plasmodium falciparum
                                                                                                                                                                                                                                                          W85284-451 represent helper T-cell class II peptides, which can bind to the human leucocyte antigens (HLA) DRAW4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes are used in the course of the invention. The specification describes that that induce a cytotoxic T lymphocyte (CTL) response, and peptides that that are used together to generate a CTL response for T-helper peptides, that are used together to generate a CTL response for the treatment or prevention of viral, fungal, bacterial or parasitic the treatment or prevention of viral immune deficiency syndrome or infections (e.g. hepatitis, acquired immune deficiency syndrome or infections or cancer (e.g. renal or cervical carcinoma, lymphoma, prostate malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma be used cancer or condyloma acuminatum). Helper T-cell peptides may be used cancer or induce a helper T cell response, e.g. in cases of autoimmune alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis, buncarcaritistic tresponse, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis, humans carcitistic tresponse tres
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition containing peptide that induces cytotoxic T lymphocyte response, and helper peptide - can bind to human leucocyte antigen alleles, used to treat or prevent cancers, parasitic infections and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-FEB-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         16-FEB-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic. plasmodium falciparum
                                                                                                                          w85284-451 represent helper T-cell class II peptides, which can bind to the human leucocyte antigens (HLA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes are used in the course of the invention. The specification describes are used in the course of the invention. The specification describes that that induce a cytotoxic T lymphocyte (CTL) response, and peptides, that are used together to generate a CTL response for T-helper peptides, that are used together to generate a CTL response for infections (e.g. hepatitis, acquired immune deficiency syndrome or infections (e.g. hepatitis, acquired immune deficiency syndrome or infections (e.g. renal or cervical carcinoma, lymphoma, prostate malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostate cancer or condyloma acuminatum). Helper T-cell peptides may be used cancer or induce a helper T cell response, e.g. in cases of autoimmune alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis, horse-constituity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     07-FEB-1997;

                                                                                                                                                                                                    W85138-283 represent helper T-cell peptides, which can bind to the human leucocyte antigens (HLA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes T-helper peptides that that induce a cytotoxic T lymphocyte (CTL) response, and the treatment or prevention of viral, fungal, bacterial or parasitic formalaria) or cancer (e.g. nepatitis, acquired immune deficiency syndrome or cancer or condyloma acuminatum). Helper T-cell peptides may be used disease, allograft rejection, allergy, Lyme disease, hepatitis, post-streptococcal endocarditis, glomerulonephritis and food

                                                                                                                                                                                                                                                                                         W85138-283 represent helper T-cell peptides, which can bind to the human leucocyte antigens (HLA) DR4w4, DR1 and DR7. The peptides are used in the course of the invention. The specification describes T-helper peptides, that are used together to generate a CTL response, and the treatment or prevention of viral, fungal, bacterial or parasitic malaria) or cancer (e.g. hepatitis, acquired immune deficiency syndrome or cancer or condyloma acuminatum). Helper T-cell peptides may be used disease, allograft rejection, allergy, Lyme disease, hepatitis, post: streptococcal endocarditis, glomerulonephritis and food

The peptides are used in the course of the invention. The specification describes peptides that that induce a cytotoxic T lymphocyte (CTL) response, and T-helper peptides, that are used together to generate a CTL response in the treatment or prevention of viral, fungal, bacterial or parasitic infections (e.g. hepatitis, acquired immune deficiency syndrome or malaria) or cancer (e.g. renal or cervical carcinoma, lymphoma, prostacancer or condyloma acuminatum). Helper T-cell peptides may be used alone to induce a helper T cell response, e.g. in cases of autoimmune disease, allograft rejection, allergy, Lyme disease, hepatitis, post-response titultis, glomerulonephritis and food by the presence of the control of the contr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Composition containing peptide that induces cytotoxic T lymphocyte response, and helper peptide - can bind to human leucocyte antigen alleles, used to treat or prevent cancers, parasitic infections and

                                                                                                                                                                         The present invention relates to a new pharmaceutical composition a unit dose form of a peptide, or analogue, comprising an epitope selected from those represented by peptides Y98812-Y99339 which care derived from various antigens for various human lecucocyte antigen and cales of the present sequence is used in the peptide peptide/Analogue binds to an HLA class II molecule at an IC-50 of less clearly analogue binds to an HLA class II molecule at an IC-50 of less clearly analogue binds to an HLA class II molecule at an IC-50 of less clearly analogue binds to induce a helper T cell response. The clear invention. II binding assay in the examples of the invention. The pharmaceutical can be used to induce a helper T cell response. The pharmaceutical focuses the immune response towards selected determinants and could therefore be used in cases of chronic viral diseases and could therefore be used in cases of chronic viral diseases and could therefore be used in cases of chronic viral diseases and could therefore be used in cases of chronic viral diseases and could therefore be used in cases of chronic viral diseases and could therefore be used in cases of chronic viral diseases and could therefore be used in cases of chronic viral diseases and could therefore be used in cases of chronic viral diseases (rheumatoid arthritis, multiple sclerosis, and mysthenia gravis), allograft containing pharmaceutical include autoimmune diseases (rheumatoid cardinos), post-streptococcal custom disease, hepatitis and food hypersensitivities. The peptide epitopes administered with the peptides. Diseases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, and could prostate cancer, hepatitis B, and could mixture include prostate cancer, hepatitis B, and could mixture include prostate cancer, hepatitis B, to determine the susceptibility of an individual to a treatment regimen. The peptides may also be used to make monoclonal could be an include prostate and could hepaticular to a treatment regimen. The c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            immune response; chronic viral disease; cancer; autoimmune disease; rheumatoid arthritis; multiple sclercosis; myasthenia gravis; AIDS; allograft rejectio; allergy; lyme disease; hepatitis; prostate cancer; glomerulonephritis; food hypersensitivity; malaria.

Database

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-i- FUNCTION: THIS PROTEIN IS ONE OF THE NUCLEAR-CODED POLYPEPTIDE CHAINS OF CYTOCHROME C OXIDASE, THE TERMINAL OXIDASE IN
MITOCHONDRIAL ELECTRON TRANSPORT.

-i- FUNCTION: THIS IS THE HEME A-CONTAINING CHAIN.

-i- CATALTTIC ACTIVITY: 4 FERROCYTOCHROME C + O(2) = 2 H(2)O + 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SEQUENCE FROM N.A.
